APPLE POMACE

Some possible alternative uses for apple pomace waste after juice extraction

Orchard tree row mulch

A series of NACM trials demonstrated many advantages of partially dried pomace as a tree mulch, especially in young orchards. Annual weeds were suppressed adequately so that herbicide spraying was minimised, fruit kept better on the ground during harvesting, and earlier tree growth and cropping was encouraged. An annual application of around 5cms was recommended. [NACM Technical Report No.3 Weed suppressant mulches for cider orchards]

Improving germination conditions for grass seed

A comparison of the germination of grass seed under mulches of pomace and citrus showed that these materials are more beneficial to germination than other products on the market. These promising results demonstrate a potential market for pomace for the establishment of grass swards in difficult environments such as roadside verges. [NACM Technical Report R 6.3]

Bioiniculants

For the production of *Trichoderma, Pennicillium and Rhizopus* spp of fungus for use in agricultural and environmental applications. For example, in the control of pathogenic organisms, for the degradation of certain pesticides and for the production of fermented foodstuffs, etc.

[Zuoxing Zheng and Shetty, Kalidas,1998. Solid-state production off beneficial Fungi on apple processing wastes using glucosamine as the indicator of growth. *J.Agric. Food Chem. Vol* 46, 2]

Shiitake and oyster mushroom production on apple pomace and sawdust

Several fungal isolate produced better on a mixture of sawdust and apple pomace which has a slightly higher N level than sawdust alone.

Worrall, J.J. and Yang, C.S. 1992. HortScience 27 [10]; 1131-33

The following 5 potential uses are taken from 'Treatment and Utilization of Apple Processing Wastes'. Processed Apple Products. Ed. Donald Dowling [Cornell].

Animal feeds

As fresh, ensiled or dried pomace, it is a suitable feed for cows and sheep.

Ethanol

Solid state fermentation process can yield between 30 - 40 g ethanol per kg of wet pomace with a heat evolution of 2.8 kJ/kg/hr.

[Hang et al, 1982. A solid state fermentation system for production of ethanol from apple pomace. *J Food Sci* 47 1851-52]

Natural gas

By applying anaerobic digestion to apple pomace, nearly 80% of organic matter can be converted into a substitute natural gas.

[Jewell and Cummings 1984, Apple pomace energy and solids recovery. J Food Sci 48 407-10]

Citric acid

Microbial production of citric acid using *Aspergillus niger* mould to convert apple pomace sugars.

[Kapooor et al 1982. Citric acid. In Prescott amd Dunn's industrial microbiology. Ed G.Reed, 709-49. AVI Pub.Co., Westport CT. Hang and Woodmans 1984, Apple pomace, a potential substrate for citric acid production by *A niger*. *Biotechnol. Lett.*6; 763-64]

Charcoal for water purification

Apple pomace may be dried, heated, ground up and moulded into charcoal briquets for combustion. This charcoal is also extremely efficacious for water purification especially in relatively high concentrations of impurities.

[Walter and Sherman 1976 Fuel value of grape and apple processing wastes. *J.Agric Food Chem. 24; 1244-45.* Jewell and Cummings 1984, Apple pomace energy and solids recovery. *J Food Sci 48 407-10.* Walter and Sherman 1975, Grape and apple pomace charcoal. *J.Agric Food Chem* 23; 1218]
